

Curtis Lopes . Jarvis Consulting

Versatile software developer with a strong academic foundation in Computer Science and hands-on experience in full-stack development and collaborative projects across both academic and professional settings. With a background that bridges technical education and real-world application, I bring a comprehensive understanding of building maintainable, scalable, high-quality software. In my professional career I have built and deployed scalable solutions using Python, Java, SQL, and Docker, and have expanded my capabilities through personal projects using C#, React, AWS and Azure. I'm driven by the rapid pace of innovation in the software industry - particularly in AI and cloud development - which continually challenge me to grow and adapt. I'm passionate about creating solutions that are not only technically sound but also impactful, and I'm excited to contribute to teams where continuous learning and cutting-edge technology come together.

Skills

Proficient: Java, Python, SQL, Linux/Bash, Javascript, Agile/Scrum, Git

Competent: C++, C#, C, Docker, REST APIs, GCP, Selenium, Node.js, Pandas/Numpy

Familiar: MongoDB, .NET MAUI, React, AWS, Azure, JUnit, Spring Boot

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_CurtisLopes

Cluster Monitor [GitHub]: Developed a lightweight monitoring agent that uses Bash scripts to collect hardware specs and real-time resource usage from Linux hosts, storing the data in a centralized PostgreSQL database. Leverage tools such as psql, docker, and crontab to automate data collection and ensure reliable scheduling. Emphasized modular scripting practices and relational database design to support scalable infrastructure monitoring for system administrators and DevOps teams.

Grep App [GitHub]: Developed a Java-based Grep application - a command-line tool that recursively searches files in a directory for lines matching a given regular expression and writes results to an output file. Implemented both traditional (loop-based) and modern (Java Streams & Lambda) approaches. Built with Maven, logged with SL4FJ, and packaged using Docker for easy deployment. The application can be used for log analysis, automated file scanning, or integration into data-processing pipelines for DevOps and system monitoring tasks.

Python Data Analytics [GitHub]: Developed a proof-of-concept analytics project for a UK-based online retailer using Python, PostgreSQL, Docker, and Jupyter Notebook. Leveraged Pandas, Matplotlib, and Seaborn to analyze historical purchase data and visualize customer behaviour. Built an RFM (Recency, Frequency, Monetary) model to segment customers and uncover insights for targeted marketing strategies. Deployed the project via GitHub and Jupyter Notebook to provide the LGS team with accessible analytics, allowing them to identify high-value customers, lapsed buyers for potential re-engagement, and improve overall sales performance.

React Trading App [GitHub]: The Trading App is a modern web-based platform for managing trader accounts and viewing real-time stock quotes via the Alpha Vantage API. Designed for internal trading teams or portfolio managers, it supports adding, removing, and viewing trader profiles. Built with a component-based architecture, the app uses ReactJS, Ant Design, React Router, and npm on the front end, with a Spring Boot backend, making it modular, scalable, and easy to extend with features like quote customization and purchase history.

Highlighted Projects

Fitness Club Management System: Developed a Fitness Club Management System using Python for the application interface and SQL for backend data management. Implemented key features including user registration, fitness tracking, room bookings, and billing. Conducted regular code reviews with team members to maintain high-quality, consistent code. The project emphasized modular design, database integration, and teamwork throughout the development process.

Weather App: Built a cross-platform weather app using .NET MAUI with C# and Xamarin.Forms, integrating the WeatherStack API to display real-time weather data. Developed and tested the application within Visual Studio using an Android emulator. The project demonstrates proficiency in mobile UI design, API integration, and cross-platform development using .NET framework.

Professional Experiences

Software Developer, Jarvis (2025-present): Collaborated with a team of developers to complete sprint-based projects assigned by our Scrum Master, following Agile methodologies throughout the development cycle. Dynamic work environment where projects varied each sprint, offering hands-on experience in adapting to different technical challenges and contributing to all phases of the development process. Utilized a range of tools and technologies including Bash scripting for process automation and Docker containerization for efficient, lightweight deployment of projects.

Accounting Associate, Bench Accounting (2021-2022): Supported a portfolio of 45 U.S. companies by analyzing and reconciling financial statements and business reports to deliver accurate financial summaries. Collaborated directly with business owners to improve accounting practices and ensure proper reporting to the IRS. Used Salesforce to track companies' progression through the accounting pipeline and to conduct client discovery for new business opportunities. Leveraged data visualization tools such as Tableau, Google Sheets, and Excel to monitor client progress and team performance, enabling data-driven goal setting and improved operational transparency.

Education

Carleton University (2022-2024), Bachelor of Computer Science (Honours), School of Computer Science

Queen's University (2014-2019), Bachelor of Arts (Honours), Applied Economics

Miscellaneous

- Udacity SQL for Data Analysis (2020)
- Soccer player
- Golfer
